

Phase 3: UI/UX Development & Customization

Goal: build the passenger-facing experience on top of the Phase 2 backend.

Service Catalog Item

"Metro Ticket Booking" catalog item with variables:

Variable	Type	Notes
Source Station	Dropdown	Mandatory
Destination Station	Dropdown	Mandatory
Journey Date	Date Picker	No past dates
Number of Passengers	Numeric	Min. 1

Published under a "Transportation" category on the Service Portal home page.

Client-Side Validation

- **onChange (Destination):** blocks same source/destination selection
- **onSubmit:** confirms all mandatory fields filled, date valid

```
function onSubmit() {  
    var source = g_form.getValue('source_station');  
    var destination = g_form.getValue('destination_station');  
    if (source === destination) {  
        g_form.addErrorMessage('Source and destination cannot be the same.');        return false;  
    }  
    return true;  
}
```

UI Policies

- Passenger count becomes mandatory only after both stations are picked
- Optional fare-preview field shown once both stations selected (informational only)

Confirmation Page

Single-screen widget showing: ticket number, journey details, final fare, and QR code — no extra navigation required.

Widgets Built

Widget	Purpose
Booking Form	Passenger journey input
Confirmation Panel	Post-submit ticket + QR display
Ops Dashboard	Booking/revenue/route analytics

Operations Dashboard

Reports built and grouped into one dashboard:

1. Total tickets booked (trend)
2. Revenue generated
3. Route-wise usage distribution
4. Daily/weekly booking trend

Placed on an admin-only portal page, separate from the passenger flow.

Branding & Theme

- Portal theme aligned to a transit-style color palette (blue/white) for recognizability
- Consistent iconography for stations, tickets, and QR codes across screens

Accessibility & Responsiveness

- Form fields sized/stacked for mobile use
- Sufficient color contrast on validation error messages
- Keyboard-navigable form fields

Usability Review

Criterion	Adjustment Made
Simplicity	Removed redundant "confirm details" screen
Consistency	Standardized spacing/buttons across pages
Responsiveness	Adjusted field widths for mobile
Clarity	Rewrote validation errors to name the exact field

Deliverable: working booking flow (Service Portal → form → QR confirmation)
+ ops dashboard, both wired to the Phase 2 backend.
