

Phase 5: Deployment, Documentation & Final Presentation

Goal: move the verified system to a deployable, documented, presentable state.

Troubleshooting Pass

Symptom	Cause Checked	Resolution
Ticket not created	Business Rule inactive/condition mismatch	Corrected condition
QR missing/delayed	QR API connectivity	Verified endpoint + retry logic
Notification not received	Trigger condition timing	Fixed to fire after QR populates
Dashboard stale	Report/dashboard cache	Cleared cache, confirmed refresh

Adherence to Timelines

- Actual completion of each phase compared against the Phase 1 roadmap
- Delays (e.g. extra ACL work in Phase 4) noted with cause
- Lessons carried into the retrospective and future-enhancements list

Deployment Checklist

- ☐ All Business Rules active in target environment
- ☐ Catalog item published and visible to correct user groups
- ☐ Roles/ACLs applied and re-verified post-migration
- ☐ Notification templates tested in target environment
- ☐ Dashboards load with live data

Change Management

- Configuration moved via scoped update sets, reviewed before commit
- Each update set mapped to a specific phase/feature for traceability

Project Innovation

- Applies ServiceNow (typically ITSM) to a consumer-facing transportation use case
- Replaces physical tickets entirely with native-platform QR automation, no external booking engine

Documentation Produced

1. **Functional Overview** — what the system does end-to-end
2. **Technical Blueprint** — UI → Logic → Data → Insight layers
3. **Setup Manual** — condensed rebuild steps:
 - a. Create catalog item + variables
 - b. Create ticket table + fields
 - c. Add client scripts + UI policies
 - d. Add business rules (fare, numbering, QR trigger)
 - e. Add QR Script Include + API integration
 - f. Configure notification
 - g. Build reports/dashboard
 - h. Configure roles/ACLs
 - i. Run QA suite
 - j. Deploy & monitor

Demo Video Plan

1. Intro — the problem (10–15s)
2. Live booking walkthrough (60–90s)
3. Backend automation view (30–45s)

4. Dashboard (20–30s)
5. Wrap-up + roadmap (10–15s)

Demo Quality Checks

- Realistic station names/dates, not placeholder data
- One validation-error case shown to demonstrate robustness
- Narration explains automation (form → rule → QR → email), not just the screen

Post-Deployment Monitoring

- Watch notification delivery success rate
- Watch QR API error rate
- Periodic dashboard accuracy spot-check

Scalability & Future Plan

- Mobile QR scanner app for entry-point validation
- Payment gateway integration
- Dynamic/peak-hour pricing
- Multi-language portal support

Deliverable: deployed, documented system with a recorded demonstration.
